# MAGMATAC™

**MAGMATAC™** is a tactile paving tile which is designed to alert visually impaired pedestrians to potential hazards.

The flexible moulded tile has been developed to offer significant benefits to users, including:-

## ◆ Easy to lay

The tiles can be bonded to asphalt, concrete or steel and, being pliable, can mould to most surface undulations. As the tiles are applied to existing surfaces there is no requirement for lengthy and expensive structural work.

## ◆ Quick

**MAGMATAC™** can be laid in busy pedestrian areas with the minimum amount of disruption and can be used within 2 hours of being laid.

## ◆ Durable

The resin bonded aggregate used in the tiles has a Moh's hardness of 9 and is suitable for use in heavily trafficked pedestrian areas.

## ◆ Compliant with standards

**MAGMATAC™** meets all of the criteria outlined by The DETR, British Standards and the Office of the Rail Regulator.

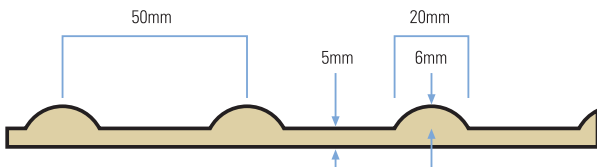

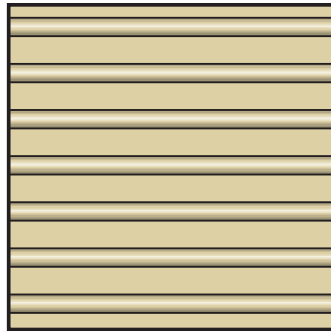

**MAGMATAC** can be incorporated onto Magma Safety Panels for use when re-decking timber footbridges and platforms.

## MAGMATAC™ is available in 3 standard patterns:

### Corduroy pattern

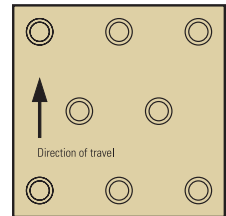

To be used in situations where visually impaired people need to be warned of hazards such as:

- ◆ The top and bottom of stairs
- ◆ The foot of a ramp to an on-street LRT
- ◆ A level crossing  
Where footways/  
footpaths join a  
shared route

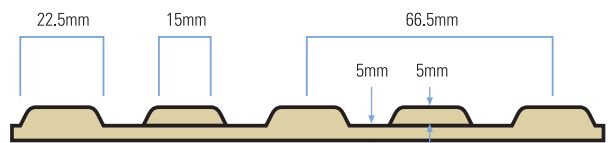

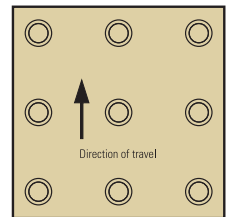

### Blister patterns

The "Off Set" blister pattern is for use on rail platforms to alert pedestrians to the proximity of the platform edge.

The "In Line" blister pattern is for use at pedestrian crossing points for road users to differentiate between where the footway ends and the carriageway begins.

**MAGMATAC™** tactile panels come in packs of 10 and are supplied with pigmented PU adhesive and application instructions.

Also available from **MAGMA:**

**ALISPAR®** External nosings and treads

**MAGMA SAFETY PANELS®** Anti-skid panels

**DECKSAFE®** Anti-skid inserts for timber decking
